Chemical Storage (manganese dioxide)

Posted by Anonymous on Wed, 2016-05-18 15:59

Chemical Storage: Hi, just wanting some clarification on the storage of manganese dioxide, please.

The previous SDS from Chem-Supply has manganese dioxide as DG Class 5.1, the new one (Jan 2016) says Not Classified as a Dangerous Good.

What would be your recommendation for storage, please?

Chemical Storage

Submitted by sat on 27 May 2016

It can be confusing when the classification of a chemical is changed. However, the manufacturer's SDS should be referred to for the classification of a specific product. We advise that this manganese dioxide may be stored with general dry chemicals, which is consistent with the information in the SDS concerning incompatibilities.

In a survey of a number of SDSs, we only found one which gave manganese dioxide the classification Dangerous Goods Class 5.1 Oxidising solid. Safe Work Australia's GHS Hazardous Chemical Information List also does not list manganese dioxide as an oxidising solid.¹

The criteria for classifying oxidising solids are as given in the UN Manual of Tests and Criteria for Dangerous Goods² and the UN Model Regulations.³ To determine whether a substance should be classified as a Class 5.1 oxidising solid, the substance is mixed with fibrous cellulose and the rate and intensity of burning of this mixture is compared with that of a reference mixture such as potassium bromate/cellulose. Whether the substance satisfies the criteria for Class 5.1 may depend on factors such as the form of the substance, the particle size, and whether or not the product contains additives or impurities.
